

# Web Development Important Tips

- The first page that you want users to view on a website must be called index.html.
- There should be no spaces in any file name
  - Use an underscore e.g. contact\_me.html
  - Start a new word with a capital letter e.g. contactMe.html
- If you are downloading a Zipped file from Moodle, make sure you unzip it to the correct location and open the correct files. - Delete duplicates
- Every website must be contained with a root directory.
- Ensure that your root directory is well structured
  - A folder called images that will contain all images used on your site
  - A folder called styles or css for css style sheets

		
	<p>A Zipped File: Download this file, then right click on it, select Extract all. Select the location you want to extract it to and then click Extract.</p>	<p>Zipped                  Unzipped</p> <p>Once you have the folder unzipped it is bet to delete it to avoid confusion</p>

- Ensure that you maintain good structure with your code (HTML and CSS)
- Know what files you are working on and where they are located - everything must be inside the root folder.
- Write and test your code in small segments to ensure that what you are doing is correct.
- Always have the W3C School open and use as a reference.

**IMPORTANT:** If you are trying to test your style sheet and you don't see any changes on the HTML page it can be down to one of the following issues

1. The there is no link in the head of the HTML page to link the page to the stylesheet.
2. The directory path to the style sheet is incorrect.
3. There is a misspelling in the name.
4. One or more of the files are you are working on are outside the root folder - check the file path for each
